

Cast molten salvaged bottle glass into thick walled 4ft. diameter deep focus paraboloids using concentrically nested parabolic stone crucibles; * SOLAR HEATED * by a giant parabolic mirror surfaced solar concentrator the size of a radio telescope, or outdoor stadium ... yielding more than twice the power of the Odeillo solar furnace.

https://en.wikipedia.org/wiki/Odeillo_solar_furnace

The glass paraboloids would be more durable, useful and multi-purposed than the old style Coca Cola bottle from "The gods Must Be Crazy!" ... AND ... would last for 1 million years; enabling u.s. to send help to mankind in the distant future by disseminating them now through out non-industrialized nations as solar cookers/water pasteurizers; a green alternative to billions of women doomed to a short life, collecting and carrying heavy burdens of firewood to fuel their village cook fires and to a death by emphysema caused by cook fire smoke inhalation. Mirror finished reflectors should be provided from food grade stainless steel mirror finished lids from (stainless) canned vegetables, (made without BPA liners), airdropped to remote villages and refugee camps, in order to feed malnourished/stunted children, while the rest of the stainless can is used as a cooking pot after being initially blackened over a cook fire prior to use; as part of a food aid program. The Opposite Of Built In Obsolescence!

The crucible molds would emboss upon each paraboloid's convex-backside, helpful universal stick figure messages of knowledge and wisdom to the future, along with jchart diagram & illustrated Earth geological history timeline stating:

- !) Greetings From The Ancient Past - We Were Here,
- 2) Sorry about the mess we left of the Earth.
- 3) Do Not Dig Up The Radioactive Nuclear Waste.
