Now that the semester is over my first thoughts about these several projects was positively negative. Positively, it brings new knowledge for me, especially in using a lot of websites, that I have never used before, and through that I know it will help me to widen my knowledge in technology, it is truly an advantage because in today's generation using technology is part of our daily necessities and routine. Since we belong in Generation Z with high technology. At the same time negatively, because it do stresses me out, honestly, it is hard for me especially we don't have WIFI at home so I usually stay late in the school library for me to finish the projects that were being given and another thing was, it was really hard to invest a lot of time in using a website that is new to you knowing that I also have a lot of other things to do. But honestly I am also grateful for the projects because it taught me to be discipline in managing my time and patience for learning things that I have never experience doing before.

Some interesting discoveries that I have discovered while doing the projects were I really do have a so much little knowledge in technology, I do have a problem with dealing with myself and also in group activities involving my group mates. To myself I do have a problem in procrastinating so it is really hard for me especially when the deadline is fast approaching I am aware of that and I know that I need to be responsible managing my time. Group activities were much more hard for me I do have a problem dealing with other people, I don't want to be angry with them because I also don't like myself being angry, so it is hard for me to inform them to cooperate with group activities and another thing was some of my classmates don't also accept suggestions and it seems like it gave me hard time expressing my ideas because it was not easy to be rejected by other people. I prefer being alone than in groups.

The hardest moments and challenges I faced and encounter was time management in a lot of performance tasks especially in this subject. It is hard to took a lot of hours facing your laptop just to figure out how to post and access the websites for free, how to attach files on it and a lot more. Another thing is it was hard to be group

with people you don't like, I consider it as a challenge because communicating with them was not really easy.

The powerful learning moments were, I experienced doing and figuring things on my own without the help of other people close to me. Back then, in every group activities I don't have hard time because I have a lot of friends to help me but since now senior high school we took different paths for our future they have transferred different schools so, I learned to depend only to myself and not other people.

Depending on myself is on me now and the best solution to achieve it is to go out to your comfort zone even though it is hard especially in the beginning but you still need to continue doing what you started for you to reach the end.

Our team communicate by sharing ideas with each other and colliding it in the end to create our desired output. For me their expectation to me didn't meet their expectation because I am not really the best and sometimes I am also lazy so I bet they are also disappointed. But the thing is I am also lazy but I want to pass before the deadline so that's it I am a procrastinator also.
